1 Introduction

This paper contains a description of the following PLONK-style circuits:

- SHA256 for block headers and transactions hashes verification.
- EdDSA for validators signature verification.
- Poseidon/Reinforce Concrete for state Merkle-tree and proof generation.

2 SHA256 Circuit

Suppose that input data in the 32-bits form, which is already padded to the required size. Checking that chunked input data corresponds to the original data out of this circuit. However, we add the boolean check and range proof.

Range proof that $a < 2^{32}$ Let $a = \{a_0, ..., a_{15}\}$, where a_i is two bits.

j+2	a_4	a_5	a_6	a_7	acc
j + 3	a_0	a_1	a_2	a_3	a

Range gate constraints:

$$w_{o,j-1} = 0$$

$$w_{1,i}(w_{1,i}-1)(w_{1,i}-2)(w_{1,i}-3) + w_{2,i}(w_{2,i}-1)(w_{2,i}-2)(w_{2,i}-3) + w_{3,i}(w_{3,i}-1)(w_{3,i}-2)(w_{3,i}-3) + w_{4,i}(w_{4,i}-1)(w_{4,i}-2)(w_{4,i}-3)$$

$$w_{o,i} = w_{o,i-1} * 4^4 + w_{4,i} * 4^3 + w_{3,i} * 4^2 + w_{2,i} * 4 + w_{1,i}$$

The range proofs are included for each input data block.
