1 Introduction

This paper contains a description of the following PLONK-style circuits:

- SHA256 for block headers and transactions hashes verification.
- EdDSA for validators signature verification.
- Poseidon/Reinforce Concrete for state Merkle-tree and proof generation.

2 SHA256 Circuit

Suppose that input data in the 32-bits form, which is already padded to the required size. Checking that chunked input data corresponds to the original data out of this circuit. However, we add the boolean check and range proof.

Range proof that $a < 2^{32}$ Let $a = \{a_0, ..., a_{15}\}$, where a_i is two bits.

$$w_{o,i} = w_{4,i} * 256^3 + w_{3,i} * 256^2 + w_{2,i} * 256 + w_{1,i}$$

7 plookup constraints

The Maj function contain sparse mapping subcircuit with base 2 for a, b, c. Let $a; b; c$ be divided to $a_0, a_1, a_2, a_3; b_0, b_1, b_2, b_3; c_0, c_1, c_2, c_3$ 8 bits-chunks. The values a'_0, a'_1, a'_2, a'_3 are in sparse form, and a' is a sparse a. Similarly for b and c. Note, that a we already have in the sparse from Σ_0 in the circuit. The variables b and c were represented in sparse form in the previous rounds or it is public inputs.

Sparse map gate constraints:

$$w_{o,j} = w_{1,j} + w_{2,j} + w_{3,j}$$

The sparse values maj have to be normalized. We use **SHA256 MAJ NORMALIZE2**

	w_1	w_2	w_3	w_4	w_o
j + 0	a'_0	a'_1	a'_2	a'_3	
j + 1	a_0	a_1	a_2	a_3	maj

Normalize gate constraints:

$$w_{o,i} = w_{4,i} * 256^3 + w_{3,i} * 256^2 + w_{2,i} * 8 + w_{1,i}$$

The final addition requires one add gate.

The Ch function   contain sparse mapping subcircuit with base 2 for e, f, g. Let $e; f; g$ be divided to $e_0, e_1, e_2, e_3; f_0, f_1, f_2, f_3; g_0, g_1, g_2, g_3$ 8 bits-chunks. The values e'_0, e'_1, e'_2, e'_3 are in sparse form, and e' is a sparse e. Similarly for b and c. Note, that e we already have in the sparse from Σ_0 in the circuit. The variables f and g were represented in sparse form in the previous rounds or it is public inputs.

Normalize gate constraints:

$$w_{o,i} = w_{4,i} * 256^3 + w_{3,i} * 256^2 + w_{2,i} * 8 + w_{1,i}$$

The final addition requires one add gate.
The updating of variables for new rounds costs 10 add gates.
Producing the final hash value costs two add gates.

2.1   SHA-512

SHA-512 uses the similar logical functions as in refsha256 which operates on 64-bits words. Thus each input uses the same range proof which extended to 64-bits.

Range proof that $a < 2^{64}$ Let $a = \{a_0, ..., a_{32}\}$, where a_i is two bits.

4   Merkle Tree Circuit

Merkle Tree generation for set $\{H_{B_{n_1}}, ..., H_{B_{n_2}}\}$. Let $k = \lceil \log(n_2 - n_1) \rceil$

1. $n = n_2 - n_1$

2. $2^k = n$

3. for i from 0 to $n - 1$:

    3.1 $T_i = H_i$ // just notation for simplicity, not a real part of the circuit

4. for i from 0 to $k - 1$:

    4.1 for j from 0 to $(n - 1)/2$:
        4.1.1 $T_i' = \texttt{hash}(T_{2 \cdot i}, T_{2 \cdot i+1})$. // see Section 3
    4.2 $n = \frac{n}{2}$
    4.3 for j from 0 to $n - 1$:
        4.3.1 $T_i = T_i'$. // just notation for simplicity, not a real part of the circuit

5   Ed25519 Circuit

To verify a signature (R, s) on a message M using public key A and a generator B do:

1. Prove that s in the range $L = 2^2 52 + 27742317777372353535851937790883648493$.

	w_1	w_2	w_3	w_4	w_o
j + 0	s	z_0	z_1	z_2	z_3
...					
j + 5	$z_2 5$			$--$	

Constraints:

$$w_{2,j} = w_{1,j} + 2^2 53 + L$$

Each $w_{i,k} - 2^1 0 \cdot w_{next}$, where $i = 2, .., o$ for $k = 0$ and $i = 1, .., o$ for $k = 1, .., 4$ is range-constrained by 10-bits plookup table.

$w_{1,j+5} \cdot 2^7$ is range-constrained by 10-bits plookup table.

2. $k == \text{SHA-512}(data||R||A||M)$ //See section 2.1

3. $sB? =? R + kA$:

    3.1 Fixed-base scalar multiplication circuit is used for $sB = S$

    3.2 One addition is used for $S + (-R)$. The coordinates of R and $T = S + (-R)$ are placed on the last row of fixed-base scalar multiplication circuit. In total, three constraints are used for addition:

$$x_t \cdot (1 + dx_s \cdot (-x_r) \cdot y_s \cdot y_r) = x_s \cdot y_r + (-x_r) \cdot y_s$$
$$y_t \cdot (1 - dx_s \cdot (-x_r) \cdot y_s \cdot y_r) = x_s \cdot (-x_r) + y_r \cdot y_s$$
$$-x_r^2 + y_r^2 = 1 - d \cdot x_r^2 \cdot y_r^2$$

    3.3 Variable-base scalar multiplication circuit has to be used in reversed order, where $(x_n, y_n) = (x_t, y_t)$.

6 The Correct Validator Set Proof Circuit

WIP

7 Bringing it all together

Let bank-hashes of proving block set be $\{H_{B_{n_1}}, ..., H_{B_{n_2}}\}$. The last confirmed block is H_{B_L}. Each positively confirmed block is signed by M validators.

Denote by `block_data` the data that is included in the bank hash other than the bank hash of the parent block.

1. $H_{B_{n_1}} = H_{B_L}$ // H_{B_L} is a public input

2. Validator set constraints. // see Section 6

3. for i from $n_1 + 1$ to $n_2 + 32$:
